

INSTALLATION AND MAINTENANCE PROCEDURES

a.) Install 6" of GRUBBLE in and under swings and slides and other elevated (surfaces.) Pay attention to "use zones", as defined by CPSC and ASTM, these zones extend 6' around all equipment and two times the height of the top rail, in front, and to the rear of the swing.

Slides have a "use zone" equal to the height of the slide plus four feet, except for the exit area which is 6' minimum. Complete use zone information and other valuable and essential safety information is available in the US Consumer Product Safety Commission Report Pub. No. 325 or later. The report is referred to as "CPSC Handbook for Public Safety." This publication should be reviewed each year.

b.) Periodic adjustments of material under swings, slides and wear areas are required.

c.) Install mats at ground level (6" below the top layer of Grubble) under swings, slides, vertical poles and/or wear areas.

d.) To insure maximum safety, conduct surface testing using a free fall test method, a minimum of once each year at three locations under and around play structures.

FAILURE TO INSTALL RUBBER GRUBBLE AND MAINTAIN ITS LEVEL OF PERFORMANCE IN AREAS OF USE zones could invalidate its guarantee. For maximum safety, mats are required under all slides, poles, slide exits, under swings and excessive wear areas.
